Overview

1 Motivations

- 2 τ lepton properties & reconstruction
- 3 Understanding of τ_{had} object • τ_{had} /jet discrimination
 - τ energy calibration
- Identification improvements
 New discriminating observables
 - Multivariate analysis optimization

Motivations

SUSY SM extention

 $\left. \begin{array}{l} \bullet ~~ \tilde{q},~\tilde{g}, \\ \bullet ~~ \mathrm{weak~gauginos},~\ldots \end{array} \right\} \mathrm{cascade~decays~can~end~with}~\tau \mathrm{'s}$

Higgs sector of MSSM After $SU(2)_{I} \times U(1)_{Y}$ symmetry breaking :

- **①** 3 neutral Higgs fields $\phi \equiv (H^0, h, A)$,
- **2** charged Higgs fields H^+, H^- .

For the neutral Higgs search :

 $_{\tau} \bullet \ \varphi \ {\rm decays} \ {\rm in} \ \tau\tau \ (10\%) \ {\rm and} \ bb \ (90\%)$

 ϕ , \bullet but $b\bar{b}$ final state : multijet bkg

Sensitive process : $p\bar{p} \rightarrow \phi \rightarrow \tau \tau$

τ lepton properties & reconstruction

The τ lepton and its reconstruction

Physical properties : $m_{\tau} = 1.78 \text{ GeV}, c\tau_{\text{life}} = 87 \ \mu\text{m}$

We will focus on hadronic decay of $\tau : \tau_{had}$

Reconstruction and DØ τ type definition for <u>hadronic</u> decay :

- $\bullet \ {\rm D} \ensuremath{\emptyset} \ {\rm type} \ 1 \equiv 1 \ {\rm trk}, \ \mbox{HAD} \ {\rm deposit} \ \ \sim \tau^\pm \to \pi^\pm \nu_\tau$
- DØ type $2 \equiv 1$ trk, EM and HAD deposit ~ $\tau^{\pm} \rightarrow \rho^{\pm} (\rightarrow \pi^0 \pi^{\pm}) \nu_{\tau}$
- DØ type 3 \equiv at least 2 trks, HAD deposit ~ $\tau^{\pm} \rightarrow a_1^{\pm} (\rightarrow \pi^{\pm} \pi^{\mp} \pi^{\pm}) \nu_{\tau}$

 τ_{had} /jet discrimination

Identification of true τ

Jets could have the same experimental signatures as hadronic τ and need to be removed.

 τ lepton identification at DØ Understanding of τ_{had} object

 τ_{had} /jet discrimination

Identification of true τ

τ_{fake} 12 discrimating observables τ_{fake} τ_{true} $E_r^{lead} + E_r^{2^{rnd}lead}$ 12 • track isolation, p_T^{trk≠τ_{can}} Neural Network • calo isolation, $\overline{\mathbf{p}_{\tau}^{trk \neq \tau_{cand}} + \mathbf{p}_{\tau}^{trk - \tau_{cand}}}$ • shower shape, NNout • trk-cal correlations. 4 65 84 0 RMScolo $\frac{c_1}{E_T + \sum_{k' \in I} p_T^{lpk}}$

Romain Madar (CEA/Irfu/SPP)

Understanding of τ_{had} object

 τ energy calibration

E_{τ} calibration : "E/p correction"

Known effect

The calorimeter response is slightly different in the simulation and in data. $\tau_{\text{measured}} \equiv \{\gamma, \pi^{\pm}\}$ energy needs a relative correction.

Correction method

Use the track energy as reference to correct simulation event by event :

$$\begin{pmatrix} \frac{E}{p} \end{pmatrix}_{MCcorr} = \begin{pmatrix} \frac{E}{p} \end{pmatrix}_{MC} \times \frac{\langle E/p \rangle_{data[Z \to \tau\tau]}}{\langle E/p \rangle_{MC}}$$
with
$$\bullet E/p \equiv E^{calo}/p^{trk} \\ \bullet \langle E/p \rangle \equiv \text{average value.}$$

$$\begin{cases} \frac{240}{200} \\ \frac{100}{100} \\$$

 τ_{had}/jet discrimination
 τ energy calibration
- Identification improvements

 New discriminating observables
 Multivariate analysis optimization

5 Conclusions and outlooks

Identification improvements

New discriminating observables

Central PreShower (CPS) for type 2

Physical idea. Exploit specific resonance of τ **type** 2 decay : $\tau^{\pm} \rightarrow \rho^{\pm} \nu \rightarrow \pi^{\pm} \pi^{0} \nu$. Use Central PreShower detector with fine segmentation : $\Delta \phi_{\rm CPS} \simeq 0.1 \times \Delta \phi_{\rm calo}$

 $CPS_{\rm cluster}\approx\pi^0$, ${\rm trk}\approx\pi^\pm$

 τ lepton identification at $D \varnothing$

Identification improvements

New discriminating observables

Central PreShower (CPS) for type 2

Physical idea. Exploit specific resonance of τ **type** 2 decay : $\tau^{\pm} \rightarrow \rho^{\pm} \nu \rightarrow \pi^{\pm} \pi^{0} \nu$. Use Central PreShower detector with fine segmentation : $\Delta \phi_{\rm CPS} \simeq 0.1 \times \Delta \phi_{\rm calo}$

Central PreShower

Identification improvements

New discriminating observables

τ is a long lived particle

Use impact parameter to remove jets faking τ more efficiently. (large $c\tau_{life} \Rightarrow large d_0$)

Identification improvements

New discriminating observables

τ is a long lived particle

Use impact parameter to remove jets faking τ more efficiently. (large $c\tau_{life} \Rightarrow large d_0$)

Identification improvements

New discriminating observables

τ is a long lived particle

Use impact parameter to remove jets faking τ more efficiently. (large $c\tau_{life} \Rightarrow large d_0$)

Clear improvement in performance!

τ lepton identification at DØ Identification improvements Multivariate analysis optimization

Multivariate analysis optimization

- \bullet Change training sample from current DØ NN_{τ} : add τ_{cand} of low $p_{T},$
- larger training sample,
- More epochs,
- More nodes.

 $\tau_{\rm true}/\tau_{\rm fake}$ differences described in more details

 τ_{had}/jet discrimination
 τ energy calibration
- 4 Identification improvements

 New discriminating observables
 Multivariate analysis optimization

5 Conclusions and outlooks

Conclusions & outlooks

General :

- τ lepton is a key object to probe new physics as well as SM physics, (see Kathy and Melvin's talks).
- Understand these objects is an experimental challenge.

Last results for the DØ experiment :

- Use Central PreShower : no significant improvement,
- $\bullet\,$ Use the decay length information : $\sim 10\%$ improvement.
- $\bullet\,$ Optimize Multivariate analysis : $\sim 10\%$ improvement.

Future plans :

• Large contamination of electrons : finer segmentation of PreShower could provide strong discriminant.

Conclusions and outlooks

Identification efficiency correction

Problem : ID efficiency ($\varepsilon_{ID} \equiv \frac{N[\tau_{NN>cut}]}{N[\tau_{true}]}$) is better in MC than in data.

Solution : Measure ID eff in data and correct the simulation :

- **1** Build a pure τ data sample $S \equiv \text{Data} \sum_i \text{Bkg}_i \approx Z \tau \tau_{\text{data}}$,
- 2 All τ^{cand} from S is assumed to be a true $\tau : \epsilon_{\text{ID}}^{\text{data}} = \frac{N[\tau_{\text{NN} > \text{cut}}]}{N_{\text{tot}}}$,
- $\label{eq:correct} \textbf{3} \ \ {\rm Correct \ the \ simulation \ to \ have \ } N_{\rm MCcorr}[\tau_{\rm NN>cut}] = N_{\rm data}[\tau_{\rm NN>cut}]:$

$$N_{\rm MCcorr}[\tau_{\rm NN>cut}] = \frac{\varepsilon_{\rm ID}^{\rm data}}{\varepsilon_{\rm ID}^{\rm MC}} \times N_{\rm MC}[\tau_{\rm NN>cut}]$$
